`constants`#

This file should hold most string literals and magic numbers used throughout the code base. The exception is if a literal is specifically meant to be private to and isolated within a module. Think of this as a "more static" source of configuration information.

Another important source of "static" configuration is conda/models/enums.py.

Classes#

`SafetyChecks` | Generic enumeration.

---|---

`PathConflict` | Generic enumeration.

`DepsModifier` | Flags to enable alternate handling of dependencies.

`UpdateModifier` | Generic enumeration.

`ChannelPriorityMeta` | Metaclass for Enum

`ValueEnum` | Subclass of enum that returns the value of the enum as its str representation

`ChannelPriority` | Subclass of enum that returns the value of the enum as its str representation

`SatSolverChoice` | Subclass of enum that returns the value of the enum as its str representation

`NoticeLevel` | Subclass of enum that returns the value of the enum as its str representation

```
_class _ChannelPriorityMeta#
```

Bases: `enum.EnumMeta`

Metaclass for Enum

```
__call__(_value_ , _* args_ , _** kwargs_)#
```

Either returns an existing member, or creates a new enum class.

This method is used both when an enum class is given a value to match to an enumeration member (i.e. `Color(3)`) and for the functional API (i.e. `Color = Enum('Color', names='RED GREEN BLUE')`).

When used for the functional API:

value will be the name of the new class.

names should be either a string of white-space/comma delimited names (values will start at start), or an iterator/mapping of name, value pairs.

module should be set to the module this class is being created in; if it is not set, an attempt to find that module will be made, but if it fails the

class will not be picklable.

qualname should be set to the actual location this class can be found at in its module; by default it is set to the global scope. If this is not correct, unpickling will fail in some circumstances.

type, if set, will be mixed in as the first base class.
