\* Request Headers

## # Request Headers#

The request headers plugin hooks allows plugin authors to add custom HTTP headers to HTTP requests within conda. This works by inserting these headers while preparing the `[requests.PreparedRequest]`(<https://docs.python-requests.org/en/latest/api/#requests.PreparedRequest>) object when calling `[requests.Session.request]`(<https://docs.python-requests.org/en/latest/api/#requests.Session.request>).

There are two hooks available for this purpose:

1. ``conda_session_headers``: This hook is used to define the custom headers that will be submitted with all HTTP requests (or a subset of hosts)
2. ``conda_request_headers``: This hook is used to define the custom headers that will be submitted with a specific HTTP request.

## Warning

While the second hook (``conda_request_headers``) can also create session

headers, it is recommended to use the first hook (`conda_session_headers()`) for improved caching performance.

```
conda_request_headers(_host :  
[str](https://docs.python.org/3/library/stdtypes.html#str "(in Python  
v3.13\)"_) , _path : [str](https://docs.python.org/3/library/stdtypes.html#str  
"(in Python v3.13\)"_)#
```

### Register new HTTP request headers

The example below defines how to add HTTP headers for all requests with the hostname of `example.com` and a `path/to/endpoint.json` path.

**Example:**

```
from conda import plugins
```

```
HOSTS = {"example.com", "sub.example.com"}
```

```
ENDPOINT = "/path/to/endpoint.json"
```

```
@plugins.hookimpl
```

```
def conda_request_headers(host: str, path: str):
```

```
if host in HOSTS and path == ENDPOINT:
```

```
    yield plugins.CondaRequestHeader(  
        name="Example-Header",  
        value="example",  
    )
```

```
conda_session_headers(_host :
```

```
[str](https://docs.python.org/3/library/stdtypes.html#str "(in Python  
v3.13\)"_))#
```

Register new HTTP request headers

The example below defines how to add HTTP headers for all requests with the hostname of `example.com`.

**\*\*Example:\*\***

```
from conda import plugins
```

```
HOSTS = {"example.com", "sub.example.com"}
```

```
@plugins.hookimpl
```

```
def conda_session_headers(host: str):
```

```
    if host in HOSTS:
```

```
        yield plugins.CondaRequestHeader(
```

```
            name="Example-Header",
```

```
            value="example",
```

```
        )
```

Both hook use the

```
[`CondaRequestHeader`](../api/conda/plugins/index.html#conda.plugins.CondaRequestHeader  
"conda.plugins.CondaRequestHeader") class to define headers:
```

```
_class _CondaRequestHeader#
```

Define vendor specific headers to include HTTP requests

For details on how this is used, see ``conda_request_headers()`` and  
``conda_session_headers()``.

Parameters:

```
* **name** \-- name of the header used in the HTTP request
```

\* \*\*value\*\* \-- value of the header used in the HTTP request

name#

value#

\_\_On this page

\* ``conda_request_headers()``

\* ``conda_session_headers()``

\* ``CondaRequestHeader``

\* ``CondaRequestHeader.name``

\* ``CondaRequestHeader.value``
