* [SentenceTransformer > Loss Overview](./sentence_transformer/loss_overview.html)
* [SentenceTransformer > Training Examples](./sentence transformer/training/examples.html)
 from sentence_transformers import SentenceTransformer
 # 1. Load a pretrained Sentence Transformer model
 model = SentenceTransformer("all-MiniLM-L6-v2")
 # The sentences to encode
 sentences = [
   "The weather is lovely today.",
   "It's so sunny outside!",
   "He drove to the stadium.",
 ]
 # 2. Calculate embeddings by calling model.encode()
 embeddings = model.encode(sentences)
 print(embeddings.shape)
```

(0.1411).

```
# 3. Calculate the embedding similarities

similarities = model.similarity(embeddings, embeddings)

print(similarities)

# tensor([[1.0000, 0.6660, 0.1046],

# [0.6660, 1.0000, 0.1411],

# [0.1046, 0.1411, 1.0000]])
```

With `SentenceTransformer("all-MiniLM-L6-v2")` we pick which [Sentence

Transformer model](https://huggingface.co/models?library=sentencetransformers) we load. In this example, we load [allMiniLM-L6-v2](https://huggingface.co/sentence-transformers/all-MiniLM-L6-v2),
which is a MiniLM model finetuned on a large dataset of over 1 billion
training pairs. Using
['SentenceTransformer.similarity()`](package_reference/sentence_transformer/SentenceTransforme
r.html#sentence_transformers.SentenceTransformer.similarity

"sentence_transformers.SentenceTransformer.similarity"), we compute the
similarity between all pairs of sentences. As expected, the similarity between
the first two sentences (0.6660) is higher than the similarity between the
first and the third sentence (0.1046) or the second and the third sentence

Finetuning Sentence Transformer models is easy and requires only a few lines of code. For more information, see the [Training Overview](./sentence_transformer/training_overview.html) section.

Read [Sentence Transformer > Usage > Speeding up Inference](sentence_transformer/usage/efficiency.html) for tips on how to speed up inference of models by up to 2x-3x.

Cross Encoderif•

Characteristics of Cross Encoder (a.k.a reranker) models:

- 1. Calculates a **similarity score** given **pairs of texts**.
- 2. Generally provides **superior performance** compared to a Sentence Transformer (a.k.a. bi-encoder) model.
- 3. Often **slower** than a Sentence Transformer model, as it requires computation for each pair rather than each text.
- 4. Due to the previous 2 characteristics, Cross Encoders are often used to **re-rank the top-k results** from a Sentence Transformer model.

The usage for Cross Encoder (a.k.a. reranker) models is similar to Sentence

Transformers:

Documentation

1. Crossencoder
2. `CrossEncoder.rank`
3. `CrossEncoder.predict`
Other useful methods and links:

* [CrossEncoder > Dataset Overview](./cross_encoder/dataset_overview.html)
* [CrossEncoder > Loss Overview](./cross_encoder/loss_overview.html)
* [CrossEncoder > Training Examples](./cross_encoder/training/examples.html)
from sentence_transformers.cross_encoder import CrossEncoder
1. Load a pretrained CrossEncoder model
model = CrossEncoder("cross-encoder/stsb-distilroberta-base")

```
# We want to compute the similarity between the query sentence...
query = "A man is eating pasta."
# ... and all sentences in the corpus
corpus = [
  "A man is eating food.",
  "A man is eating a piece of bread.",
  "The girl is carrying a baby.",
  "A man is riding a horse.",
  "A woman is playing violin.",
  "Two men pushed carts through the woods.",
  "A man is riding a white horse on an enclosed ground.",
  "A monkey is playing drums.",
  "A cheetah is running behind its prey.",
]
# 2. We rank all sentences in the corpus for the query
ranks = model.rank(query, corpus)
# Print the scores
print("Query: ", query)
for rank in ranks:
  print(f"{rank['score']:.2f}\t{corpus[rank['corpus_id']]}")
Query: A man is eating pasta.
0.67 A man is eating food.
0.34 A man is eating a piece of bread.
```

```
0.08 A man is riding a horse.
  0.07
         A man is riding a white horse on an enclosed ground.
  0.01
         The girl is carrying a baby.
  0.01
         Two men pushed carts through the woods.
  0.01
         A monkey is playing drums.
  0.01
         A woman is playing violin.
  0.01
         A cheetah is running behind its prey.
  11 11 11
  # 3. Alternatively, you can also manually compute the score between two sentences
  import numpy as np
  sentence_combinations = [[query, sentence] for sentence in corpus]
  scores = model.predict(sentence_combinations)
  # Sort the scores in decreasing order to get the corpus indices
  ranked_indices = np.argsort(scores)[::-1]
  print("Scores:", scores)
  print("Indices:", ranked indices)
  .....
       Scores: [0.6732372, 0.34102544, 0.00542465, 0.07569341, 0.00525378, 0.00536814,
0.06676237, 0.00534825, 0.00516717]
  Indices: [0 1 3 6 2 5 7 4 8]
```

With `CrossEncoder("cross-encoder/stsb-distilroberta-base")` we pick which

[CrossEncoder model](./cross_encoder/pretrained_models.html) we load. In this example, we load [cross-encoder/stsb-distilroberta-base](https://huggingface.co/cross-encoder/stsb-distilroberta-base), which is a [DistilRoBERTa](https://huggingface.co/distilbert/distilroberta-base) model finetuned on the [STS Benchmark](https://huggingface.co/datasets/sentence-transformers/stsb) dataset.
