# `conda init`#
Initialize conda for shell interaction.
  usage: conda init [-h] [--all] [--user] [--no-user] [--system] [--reverse]
              [--json] [--console CONSOLE] [-v] [-q] [-d]
              [SHELLS ...]
## Positional Arguments#
`SHELLS`
```

Possible choices: bash, fish, tcsh, xonsh, zsh, powershell

Select the backend to use for normal output rendering.

`-v, --verbose`

Can be used multiple times. Once for detailed output, twice for INFO logging, thrice for DEBUG logging, four times for TRACE logging.

`-q, --quiet`

Do not display progress bar.

Key parts of conda's functionality require that it interact directly with the shell within which conda is being invoked. The conda activate and conda deactivate commands specifically are shell-level commands. That is, they affect the state (e.g. environment variables) of the shell context being interacted with. Other core commands, like conda create and conda install, also necessarily interact with the shell environment. They're therefore implemented in ways specific to each shell. Each shell must be configured to make use of them.

This command makes changes to your system that are specific and customized for each shell. To see the specific files and locations on your system that will be affected before, use the '--dry-run' flag. To see the exact changes that are being or will be made to each location, use the '--verbose' flag.

IMPORTANT: After running conda init, most shells will need to be closed and restarted for changes to take effect.
